

The Best Just Got Better!

SkyTrak™ GPS Velocity "Super Sensor"

How did it get better?

By putting "power" and "status" indicators **in the cab** where you can verify:

1. Power to the unit.
2. Satellite lock.
3. Pulse output when moving.

No one else gives you all this!

With SkyTrak - There is No Need to "Guess" If the Unit is Working Properly.

Plus the same great features it always had!

- 7Hz 16 Channel Receiver for Accuracy During Acceleration - *it's as accurate as you will ever need!*
- WAAS Enabled for Added Accuracy
- Plug Compatible with 3 or 4 Pin Radars and Wheel Speed Sensors
- Predictable Pulse Output per Distance Traveled
- Battery Back Up of Satellite Data for SuperQuick Start Up - *no one else gives you this either!*
- Quick and Easy Installation
- Not Affected by Crop or Ground Conditions
